DETAILED ACTION

This Office Action is in response to the Applicant's Remarks and Amendments filed August 20, 2007.

Claims 27 and 36 are amended.

Claims 2, 7, 8, 12, 21 and 28 remain cancelled.

Claims 39 and 40 are newly cancelled.

Claim 41 is newly added.

Claims 1, 3-6, 9-11, 13-19, 22-27, 29-38, and 41 are pending and herein considered.

Response to Arguments

Applicant's arguments, with respect to the Examiner's 35 USC 112 rejection of claim 37 have been fully considered and are persuasive. The 35 USC 112 rejection of claims 37 has been withdrawn.

Applicant's arguments with respect to claims 1, 3-6, 9-11, 13-19, 22-27, 29-38, and 41 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claim 41 is rejected under 35 U.S.C. 101 because the claimed invention is not limited to a single statutory subject matter class. Although claim 41's preamble calls for a method of manufacturing a device, the limitations of the claim stray from such objectives, instead setting forth a memory containing bits, the writing of which allows for the enablement of a cryptographic subsystem.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 41 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Although the preamble of claim 41 calls for "a method of manufacturing a processor-based device," the Applicant fails to provide any steps or limitations regarding the manufacturing of a processor-based device, or any device for that matter.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

⁽e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States

Art Unit: 2137

only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1, 3-6, 9-11, 13-19, 22-27, 29-38, and 41 are rejected under 35
U.S.C. 102(e) as being anticipated by US Patent Application Publication No.
2002/0172359 A1 to Markku-Juhani Saarinen, hereinafter referred to as Saarinen.

Regarding **claim 1**, Saarinen discloses a method of generating a cryptographic key for a cryptographic security subsystem of a processor-based device, the method comprising the acts of (a) detecting occurrence of a first type of triggering event (par 32); (b) writing one or more bits of data to a seed pool upon termination of the first type of triggering event, the seed pool comprising a state bit indicative of a state of the seed pool (par 32); (c) detecting occurrence of a second type of triggering event (par 32); (d) writing one or more bits of data to the seed pool upon termination of the second type of triggering event, wherein act (d) comprises masking one or more bits of data to the seed pool upon termination of the second type of triggering event (pars 27, 32, 33, 37, 42); (e) examining the state bit to determine whether the seed pool is full (pars 33, 72); and (f) if the seed pool is not full, repeating acts (a) through (e) until the seed pool is full (pars 33, 72); and (g) generating a pseudo-random number from the seed pool, wherein the pseudo-random number is used to generate a cryptographic key for the cryptographic security subsystem of the processor based device (par 27).

Regarding **claim 3**, Saarinen teaches wherein the first type of triggering event has a variable duration (pars 27, 32).

Art Unit: 2137

Regarding **claims 4-6**, Saarinen teaches wherein that the processor-based device is coupled to a communication link, and includes the act of receiving a communication from the communication link, the link comprising a plurality of types (pars 25, 27, 32, 33).

Regarding **claim 9,** Saarinen teaches wherein act (d) comprises capturing the one or more bits of data from a free-running timer upon termination of the second type of triggering event (pars 31, 32).

Regarding **claim 10**, Saarinen teaches wherein the second type of triggering event is different than the first type of triggering event (par 27, 32).

Regarding **claim 11**, Saarinen teaches wherein the second type of triggering event is a cycle of power applied to the processor-based device (pars 74-75).

Regarding claim 13, Saarinen discloses a method of initializing a seed pool for generating a cryptographic key for a cryptographic security subsystem of a processor-based device, the method comprising the acts of (a) prior to enabling the cryptographic security subsystem, writing a plurality of bits of data to a seed pool, the plurality of bits of data having a signature value (par 32); (b) detecting occurrences of a first type of triggering event (par 32); (c) writing one or more bits of data to the seed pool upon termination of the first type of triggering event, the one or more bits of data altering the signature value of the seed pool (par 32); and (d) enabling the cryptographic security subsystem when more than a predetermined portion of the signature value of the seed pool has been altered (pars 33, 72); and (e) generating a pseudo-random number from the seed pool, wherein the pseudo-random number is used to generate the

Art Unit: 2137

cryptographic key for the cryptographic security subsystem of the processor based device (par 27).

Regarding **claims 14 and 15**, Saarinen discloses wherein the first type of triggering event comprises either a cycle of power applied to the processor-based device or a reboot of the processor-based device (pars 25, 27, 32, 33, 74).

Regarding **claim 16**, Saarinen discloses wherein act (c) comprises the act of masking the one or more bits of data into the seed pool (pars 27, 32, 33, 37, 42).

Regarding **claim 17**, Saarinen discloses wherein act (c) comprises the act of capturing the one or more bits of data from a free-running timer (pars 25, 27, 31, 32, 33).

Regarding **claim 18**, Saarinen discloses detecting a second type of triggering event; determining if the seed pool is full; and writing one or more bits of data to the seed pool upon termination of the second type of triggering event if the seed pool is not full (pars 33, 72).

Claim 19 is directed towards a device's implementation of the method of claim 1 and is rejected by similar rationale.

Claim 22 is directed towards a device's implementation of the method of claim 3 and is rejected by similar rationale.

Claim 23 is directed towards a device's implementation of the method of claim 4 and is rejected by similar rationale.

Claim 24 is directed towards a device's implementation of the method of claim 5 and is rejected by similar rationale.

Art Unit: 2137

Regarding **claim 25**, Saarinen teaches wherein the interface controller comprises an RS232 interface controller (pars 25, 27, 32).

Claim 26 is directed towards a device's implementation of the method of claim

11 and is rejected by similar rationale.

Regarding claim 27, Utz discloses a processor-based device comprising: a host processing system, the host processing system comprising a processor (pars 25, 34); a communications management system in communication with the host processing system (pars 25, 34); a memory system in communication with the host processing system and the communications management system (par 25), wherein the communications management system comprises: an interface controller (pars 25, 26, 32); a non-volatile memory device to store a seed pool comprising a plurality of data bits (par 25, 28); and security logic in communication with the interface controller and the non-volatile memory device, the security logic configured to establish a secure communication session between the processor-based device and an external device in communication with the processor-based device via the interface controller (pars 25-26), and wherein the security logic is configured to: write one or more bits to the seed pool, wherein the one or more bits originate from a source external to the seed pool and alter a signature value (par 32); determine whether the plurality of data bits in the seed pool has at least a portion of a signature value (par 33) and disable establishment of the secure communication session if the plurality of data bits has at least a portion of the signature value (par 33).

Art Unit: 2137

Regarding **claim 29**, Saarinen discloses a main power supply to supply power to the processor-based device, and wherein the first type of triggering event comprises a cycle of the power supplied by the main power supply (pars 74-75).

Regarding **claims 30-31**, Saarinen discloses wherein the security logic is configured to detect a second type of triggering event; determine whether the seed pool is fully populated; and write one or more data bits to the seed pool upon termination of the second type of triggering event if the seed pool is not fully populated (pars 33, 72) and wherein the second type of triggering event comprises receipt of a communication from the external device via the interface controller (pars 25, 27, 32).

Regarding **claim 32**, Saarinen discloses wherein the interface controller comprises a network interface controller (pars 25, 27, 32).

Regarding **claim 33**, Saarinen teaches wherein the act of capturing one or more bits of data from a free-running timer upon termination of the first type of triggering event (pars 25, 27, 32).

Claim 34 is directed towards a device's implementation of the method of claim 33 and is rejected by similar rationale.

Regarding **claim 35**, Saarinen discloses wherein the security logic is configured to detect a first type of triggering event, and to write one or more data bits to the seed pool upon termination of the first type of triggering event (pars 25, 27, 32).

Regarding **claim 36**, Saarinen discloses a method for restoring security data to non-volatile memory in a computer system comprising: writing bits to a seed pool in discrete increments corresponding to a triggering event, wherein the seed pool is stored

Art Unit: 2137

in a portion of a non-volatile memory device (pars 32-33); tracking the state of the seed pool to determine if the seed pool is fully populated, wherein tracking the state of the seed pool comprises examining a state bit that changes states when the seed pool is fully populated or examining the position of a pointer to determine whether the portion of the non-volatile memory storing the seed pool is full (pars 33, 72); and precluding access to the computer system if it is determined that the seed pool is not fully populated (pars 33, 72).

Regarding **claim 37**, Saarinen further discloses wherein the triggering even comprises receipt of a query from a device external to the computer system (pars 25, 27, 32).

Regarding **claim 38**, Saarinen further discloses wherein writing bits to the seed pool in discrete increments corresponding to the triggering even comprises masking bits into the seed pool in discrete increments corresponding to a power cycle of the computer (pars 74-75).

Regarding **claim 41**, Saarinen discloses a method of manufacturing a processor-based device comprising: providing a memory comprising a seed pool, wherein the seed pool contains a plurality of bits having a signature value (par 33); writing one or more bits of data to the seed pool upon termination of a first type of triggering event (pars 25, 27, 32); and enabling a cryptographic security subsystem when more than a threshold amount of the signature value of the seed pool has been altered (par 33).

Art Unit: 2137

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tamara Teslovich whose telephone number is (571) 272-4241. The examiner can normally be reached on Mon-Fri 8-4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Emmanuel Moise can be reached on (571) 272-3865. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
